

DSWD DROMIC Report #13 on the Mayon Volcanic Activity as of 20 June 2023, 6PM

I. Situation Overview

- As of **20 June 2023** at **8AM**, **Alert Level 3** is maintained over Mayon Volcano, which means that it is currently in a relatively high level of unrest as magma is at the crater and hazardous eruption within weeks or even days is possible.
- In the past 24-hour period, very slow effusion of lava from the summit crater of Mayon Volcano continued to feed lava flows and collapse debris on the Mi-isi (south) and Bonga (southeastern) gullies. The lava flows have advanced to maximum lengths of two thousand five hundred (2500) meters and one thousand eight hundred (1800) meters along Mi-isi and Bonga gullies, respectively, from the summit crater while collapse debris have deposited to three thousand three hundred (3300) meters from the crater. A total of two (2) dome-collapse pyroclastic density currents (PDC) that lasted two (2) to three (3) minutes, three hundred one (301) rockfall events, and one (1) volcanic earthquake were recorded by the Mayon Volcano Network. Continuous moderate degassing from the summit crater produced steam-laden plumes that rose 800 m before drifting to the general west. Sulfur dioxide (SO₂) emission averaged 389 tonnes/day on 19 June 2023. Short-term observations from EDM and electronic tiltmeter monitoring show the upper slopes to be inflating since February 2023. Longer-term ground deformation parameters based on EDM, precise leveling, continuous GPS, and electronic tilt monitoring indicate that Mayon is still inflated, especially on the northwest and southeast.
- It is therefore recommended that the 6-km radius Permanent Danger Zone (PDZ) be evacuated due to the danger of PDCs, lava flows, rockfalls and other volcanic hazards.
- Increased vigilance against pyroclastic density currents, lahars and sediment-laden streamflows along channels draining the edifice is also advised. Heavy rainfall could generate channel-confined lahars and sediment-laden streamflows in channels where PDC deposits were emplaced.
- Civil aviation authorities must also advise pilots to avoid flying close to the volcano's summit as ash from any sudden eruption can be hazardous to aircraft. Based on the current prevailing wind pattern, ash fall events may most likely occur on the south side of the volcano.
